Abstract Local bending propensity and curvature of DNA can be characterized using a vector description of DNA bendability, based on a set of parameters derived from deoxyribonuclease I (DNase I) cleavage experiments. Two characteristics – arithmetic and vector averages of bendability – were successfully used to predict experimentally known bendable, rigid and curved segments in DNA. A characteristic distribution of bendability is conserved in evolutionarily related kinetoplast sequences. An analysis of the *M. genitalium* and *H. influenzae* genomes as well as fragments of human and yeast genomes shows, on the other hand, that highly curved segments – similar to artificially designed curved oligonucleotides – are extremely rare in natural DNA.

Key words: Bendability; DNase I cleavage

1. Introduction

The ability of DNA to bend is thought to play important roles in processes such as gene regulation, packaging and DNA replication. Recently, trinucleotide bending propensity parameters were deduced from deoxyribonuclease I (DNase I) digestion data [1,2]. DNase I, an enzyme with no pronounced sequence specificity, bends DNA towards the major groove [3,4]. Since the cleavage rate is thought to primarily depend on the bendability of DNA in this direction [5], we consider these trinucleotide parameters as indicators of bendability, i.e. flexibility in the direction of the major groove. This is an approximation since these DNase I-derived parameters do not in principle discriminate between bendability and inherent bending towards the major groove [1,2].

Here we attempt to classify DNA sequence segments into groups based on their bendability properties predicted from the sequence. We show that a simple vectorial representation can be used to compute numeric indices that correlate well with DNA curvature, and a 2D plot of these allows one to identify stiff, bendable and curved segments in long DNA sequences.

2. Materials and methods

The DNA sequences were taken from the EMBL and the GenBank nucleotide sequence databanks and are indicated in the text by GenBank locus names. The bendability parameters were determined by DNase I digestion experiments [1]. For the purposes of the present calculations the values were recalculated to a relative scale between 0 and 10, so that 0 corresponds to the most rigid and 10 to the most bendable segments [2]. Bendability plots were drawn by first dividing a DNA sequence into overlapping trinucleotides, then assigning a bendability value given in Table 1 to the center of each trinucleotide. (In this way the first and last nucleotides will have no values so a sequence of 32 residues will have 30 values.) Average bendability and helical asymmetry (see below at Eq. 1) were calculated for segments of 32 bp, i.e. approximately three helical turns. The calculated profiles do not significantly depend on this window length. Random sequences were generated by random shuffling the sequence of entire genomes. The shuffled sequences were then divided into overlapping segments of 32 residues for the calculation of the values given in Table 1 which are averages and standard deviations calculated from 10 runs of randomization.

3. Results and discussion

3.1. A vector representation of DNA bendability

Helical circle diagrams offer a simple visual way to represent the angular distribution of bendability within DNA segments. In this representation, the bendability parameters are drawn as vectors pointing towards the major groove, and plotted along idealized B-DNA (Fig. 1). Sequence motifs that are curved according to experimental data show a strongly asymmetric vector distribution. This is shown by two examples in Fig. 1, a kinetoplast minicircle sequence

Table 1
DNase I-based relative bendability parameters [2]

Trinucleotide	Relative bendability (a.u.)
AAA/TTT	0.1
AAC/GTT	1.6
AAG/CTT	4.2
AAT/ATT	0.0
ACA/TGT	5.8
ACC/GGT	5.2
ACG/CGT	5.2
ACT/AGT	2.0
AGA/TCT	6.5
AGC/GCT	6.3
AGG/CCT	4.7
ATA/TAT	9.7
ATC/GAT	3.6
ATG/CAT	8.7
CAA/TTG	6.2
CAC/GTG	6.8
CAG/CTG	9.6
CCA/TGG	0.7
CCC/GGG	5.7
CCG/CGG	3.0
CGA/TCG	5.8
CGC/GCG	4.3
CTA/TAG	7.8
CTC/GAG	6.6
GAA/TTC	5.1
GAC/GTC	5.6
GCA/TGC	7.5
GCC/GGC	8.2
GGA/TCC	6.2
GTA/TAC	6.4
TAA/TTA	7.3
TCA/TGA	10.0
